Knots in Three and Four Dimensions, 2

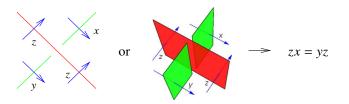

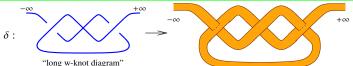

A Stronger Invariant. There is an assignment of groups to knots / 2-knots as follows. Put an arrow "under" every un-broken curve / surface in a broken curve / surface diagram and label it with the name of a group generator. Then mod out by relations as below.

Facts. The resulting "Fundamental group" $\pi_1(K)$ of a knot / 2knot *K* is a very strong but not very computable invariant of *K*. Though it has computable projections; e.g., for any finite *G*, count the homomorphisms from $\pi_1(K)$ to *G*.

Exercise. Show that $|\operatorname{Hom}(\pi_1(K) \to S_3)| = \lambda(K) + 3$.

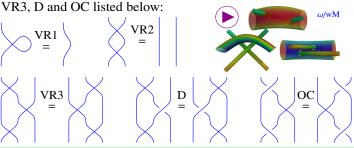

Satoh's Conjecture. (Satoh, Virtual Knot Presentations of

 \longrightarrow "simple long knotted 2D tube in 4D"

Ribbon Torus-Knots, J. Knot Theory and its Ramifications **9** (2000) 531–542). Two long w-knot diagrams represent via the map δ the same simple long 2D knotted tube in 4D iff they differ

by a sequence of R-moves as above and the "w-moves" VR1–
