# Meta-Groups, Meta-Bicrossed-Products, and the Alexander Polynomial, 2

A Meta-Bicrossed-Product is a collection of sets  $\beta(\eta, \tau)$  and mean business! operations  $tm_w^{uv}$ ,  $hm_z^{xy}$  and  $sw_{ux}^{th}$  (and lesser ones), such that  $\begin{bmatrix} s_{\text{simp}} & \text{Factor} \\ s_{\text{collect}} & \text{Essimp} \end{bmatrix} := \begin{bmatrix} s_{\text{simp}} & \text{s} \end{bmatrix} := \begin{bmatrix}$ conditions). A meta-bicrossed-product defines a meta-group with  $G_{\gamma} := \beta(\gamma, \gamma)$  and gm as in (3).

Example. Take  $\beta(\eta,\tau) = M_{\tau \times \eta}(\mathbb{Z})$  with row operations for the tails, column operations for the heads, and a trivial swap.

### $\beta$ Calculus. Let $\beta(\eta,\tau)$ be

$$\left\{ \begin{array}{c|ccc} \omega & h_1 & h_2 & \cdots \\ \hline t_1 & \alpha_{11} & \alpha_{12} & \cdot \\ t_2 & \alpha_{21} & \alpha_{22} & \cdot \\ \vdots & \cdot & \cdot & \cdot \end{array} \right. \quad h_j \in \eta, \ t_i \in \tau, \ \text{and} \ \omega \ \text{and}$$
the  $\alpha_{ij}$  are rational functions in a variable  $X$ 

$$tm_w^{uv}: \begin{array}{c|cccc} & \omega & \cdots & & \omega & \cdots & & \omega_1 & \eta_1 & \omega_2 & \eta_2 \\ \hline tu_w & \alpha & & \overline{t_w} & \alpha + \beta & & \overline{\tau_1} & \alpha_1 & \overline{\tau_2} & \alpha_2 \\ \vdots & \gamma & & \vdots & \gamma & & \underline{\omega_1\omega_2} & \eta_1 & \eta_2 \\ & \vdots & \gamma & & \overline{\tau_2} & 0 & \alpha_2 \\ \end{array},$$

where  $\epsilon := 1 + \alpha$  and  $\langle c \rangle := \sum_i c_i$ , and let

$$R_{ab}^{p} := \begin{array}{c|cccc} 1 & h_{a} & h_{b} \\ \hline t_{a} & 0 & X-1 \\ t_{b} & 0 & 0 \end{array} \qquad R_{ab}^{m} := \begin{array}{c|cccc} 1 & h_{a} & h_{b} \\ \hline t_{a} & 0 & X^{-1}-1 \\ \hline t_{b} & 0 & 0 \end{array}.$$

Theorem.  $Z^{\beta}$  is a tangle invariant (and more). Restricted to knots, the  $\omega$  part is the Alexander polynomial. On braids, it  $\log[\beta = \beta]/(gm_{1k+1}, \{k, 2, 10\}); \beta$ is equivalent to the Burau representation. A variant for links contains the multivariable Alexander polynomial.

### Why Happy? • Applications to w-knots.

- Everything that I know about the Alexander polynomial can be expressed cleanly in this language (even if without proof), except HF, but including genus, ribbonness, cabling, v-knots, knotted graphs, etc., and there's potential for vast generalizations.
- The least wasteful "Alexander for tangles' I'm aware of.
- Every step along the computation is the invariant of something.
- Fits on one sheet, including implementation & propaganda.

Further meta-monoids.  $\Pi$  (and variants),  $\mathcal{A}$  (and quotients),  $\mathcal{S}$ . Find the "reality condition".  $vT, \ldots$ 

Further meta-bicrossed-products.  $\Pi$  (and variants),  $\overline{\mathcal{A}}$  (and 7. Categorify. quotients),  $M_0$ , M,  $\mathcal{K}^{bh}$ ,  $\mathcal{K}^{rbh}$ , ...

Meta-Lie-algebras.  $\mathcal{A}$  (and quotients),  $\mathcal{S}, \dots$ 

Meta-Lie-bialgebras.  $\mathcal{A}$  (and quotients), ...

I don't understand the relationship between gr and H, as it appears, for example, in braid theory.

$$\label{eq:ts} \begin{split} & ts = \text{Union}\big[\text{Cases}\big[\text{B}[\omega,\ \varLambda],\ t_{\underline{u}} \Rightarrow \underline{u},\ \text{Infinity}\big]\big]; \\ & hs = \text{Union}\big[\text{Cases}\big[\text{B}[\omega,\ \varLambda],\ h_{\underline{x}} \Rightarrow \underline{x},\ \text{Infinity}\big]\big]; \end{split}$$
M = Outer[ $\beta$ Simp[Coefficient[A,  $h_{m1}t_{m2}$ ]] &, hs, ts]; PrependTo[M, t, & /@ ts];

M = Prepend[Transpose[M], Prepend[h<sub>E</sub> & /@ hs, \omega]]; gm,
MatrixForm[M]];

 $Do[\beta = \beta // gm_{1k\rightarrow 1}, \{k, 11, 16\}]; \beta$  $\left(-\frac{1-4 \times +8 \times^2 -11 \times^3 +8 \times^4 -4 \times^5 + \times^6}{1-4 \times^6 \times^4 -4 \times^5 + \times^6}\right)$ 

A Partial To Do List. 1. Where does it more simply come from?

- 2. Remove all the denominators.
- 3. How do determinants arise in this context?
- 4. Understand links ("meta-conjugacy classes").
- 6. Do some "Algebraic Knot Theory".
- 8. Do the same in other natural quotients of the v/w-story.

"God created the knots, all else in topology is the work of mortals. Leopold Kronecker (modified)
