

Khovanov Homology

Mikhail Khovanov

What is it?

A cube for each knot/link projection;

Vertices: All fillings of with or with .

Edges: All fillings of $I \times \text{Knot} = \text{Cobordism}$ with $I \times \text{Crossing} = \text{Cobordism}$ or with $I \times \text{Crossing} = \text{Cobordism}$ and precisely one .

Where does it live?

In $Kom(Mat(\langle Cob \rangle / \{S, T, 4Tu\})) / \text{homotopy}$:

Kom : Complexes Cob : Cobordisms

$\langle \dots \rangle$: Formal lin. comb. Mat : Matrices

S : = 0 T : = 2

Jones/Kauffman?

A **TQFT** takes it to a complex whose graded Euler characteristic is the Jones polynomial.

The key point: $\rightarrow V = \langle v_+, v_- \rangle$, $\deg v_{\pm} = \pm 1$
 $q\text{-dim } V = q + q^{-1}$

$$V^{\otimes 3} \xrightarrow{(q + q^{-1})^3} (V^{\otimes 2} \oplus V^{\otimes 2} \oplus V^{\otimes 2})\{1\} \xrightarrow{3q(q + q^{-1})^2} (V \oplus V \oplus V)\{2\} \xrightarrow{3q^2(q + q^{-1})} V^{\otimes 2}\{3\} \xrightarrow{q^3(q + q^{-1})^2}$$

V. Jones

L. Kauffman

But is it invariant?

(With similar proofs for R-II and R-III)

Why is it interesting?

1. It is stronger than the Jones polynomial.
2. It is less understood than the Jones polynomial:
 - a. Does it have a topological interpretation?
 - b. Does it have a "physical" interpretation?
 - c. Does it also work for other quantum invariants?
 - d. Does it work for manifolds and for knots in manifolds?
 - e. Is there a relation with finite-type invariants?
 - f. Does it work for "virtual knots"?
3. Jacobsson, Khovanov: It is a functor!!!
(from knots and cobordisms to complexes and morphisms)

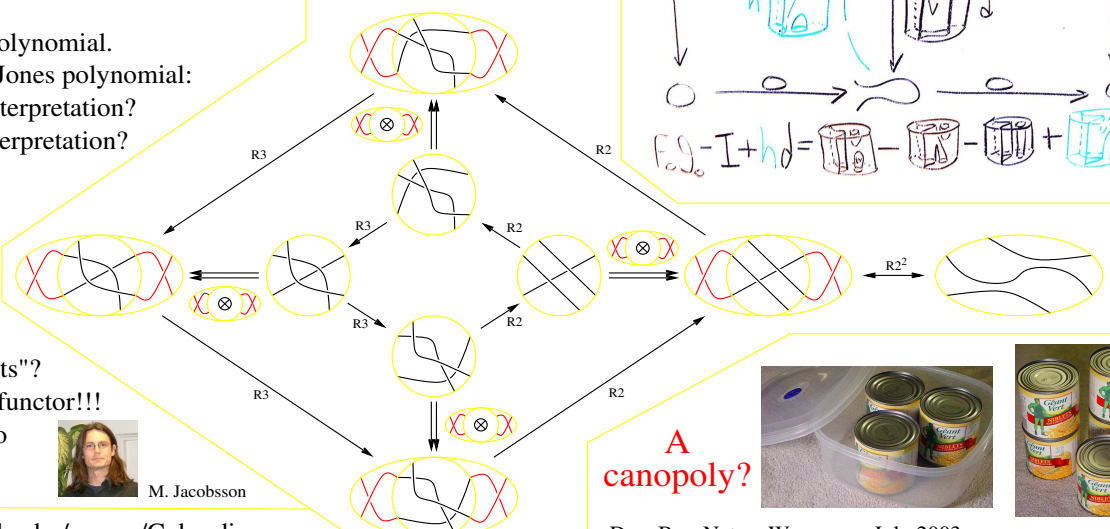

M. Jacobsson

A functor?

A canopoly?

Dror Bar-Natan, Warszawa, July 2003.
