KHOVANOV HOMOLOGY FOR KNOTS AND LINKS WITH UP TO 11 CROSSINGS

DROR BAR-NATAN

ABSTRACT. We provide tables of the ranks of the Khovanov homology of all prime knots and links with up to 11 crossings.

The programs with which it was produced are at `http://www.math.toronto.edu/~drorbn/papers/Categorification/` and/or at `http://www.math.toronto.edu/~drorbn/KAtlas/Manual/`.

1. Khovanov Homology

In his seminal paper [Kh1] Khovanov (see also [BN1]) describes a chain complex $\mathcal{C}(L)$ of graded $\mathbb{Z}$-modules, associated to any knot- or link-diagram L. The Khovanov complex has the following properties, which make it interesting and which suggest that it is but the tip of an iceberg, and that many further results are likely to follow:

- The homology of $\mathcal{C}(L)$ (indeed the homotopy class of $\mathcal{C}(L)$) is an invariant of the knot/link described by L. Below we call it $KH(L)$.
- The graded Euler characteristic of $\mathcal{C}(L)$ is the Jones polynomial $J(L)$ of L.
- $KH(L)$ is a finer knot/link invariant than $J(L)$.
- $\mathcal{C}(L)$ and $KH(L)$ can be extended to tangles [Kh2, BN2].
- As is often the case with homology, $KH(L)$ is functorial in the appropriate sense — it extends to a (projective) functor from the category of knot cobordisms to the category of $\mathbb{Z}$-modules [Ja, Kh3, BN2].
- In particular, there is an associated invariant of 2-knots and 2-links in 4-space.
- Much is known about generalizations and relations of the Jones polynomial, but little is known about generalizations and relations of its "categorification" the Khovanov homology. Thus little is known about categorification in the context of other Lie algebras, of 3-manifolds and/or knots and links inside 3-manifolds, of finite type invariants and of virtual knots, and we don't yet know if Khovanov homology has a rich relation with quantum field theory as does the Jones polynomial. Some promising signs are in [OS, Kh4].

The only purpose of this report is to provide tables of ranks of the Khovanov homology for all prime knots and links with up to 11 crossings, as computed by the program described in [BN1].

We believe our notation is mostly self-explanatory. Our only comments are:

- Knots with up to 10 crossings are enumerated as in Rolfsen's table [Ro], except that the duplication in the "Perko pair" ($10_{161} = 10_{162}$) was removed, and hence Rolfsen's 10_{163} through 10_{166} are ours 10_{162} through 10_{165}. The pictures below (for these knots) were generated using R. Scharein's program KnotPlot [Sc].
- Knots with 11 crossings and all links are enumerated as by J. Hoste and M. Thistlethwaite program Knotscape [HT], which also produced their pictures. As Knotscape doesn't keep track of the orientation of $\mathbb{R}^3$, the picture of each of these knots or links may in fact be a picture of its mirror image.
- To save space underline negative numbers; thus $\underline{1} = -1$.
- A symbol like 2^3_4 means "2 homology classes in KH^3 at degree 4", and thus a line like "3_1: $1^{\underline{3}}_{\underline{9}}1^{\underline{2}}_{\underline{5}}1^{0}_{\underline{3}}1^{0}_{\underline{1}}$" means that the total Khovanov homology of 3_1 is four dimensional, with one class of degree -9 in $KH^{-3}(3_1)$, one class of degree -5 in $KH^{-2}(3_1)$, and two classes in $KH^0(3_1)$, one each of degrees -3 and -1.
