

## 6 Continuity and homeomorphisms

**Definition 6.1** Let  $X$  and  $Y$  be topological spaces. A function  $f : X \rightarrow Y$  is a *continuous function* if and only if for every open set  $U$  in  $Y$ ,  $f^{-1}(U)$  is open in  $X$ .

**Theorem 6.1** Let  $f : X \rightarrow Y$  be a function. Then the following are equivalent:

1.  $f$  is continuous,
2. for every closed set  $K$  in  $Y$ ,  $f^{-1}(K)$  is closed in  $X$ ,
3. if  $p$  is a limit point of  $A$  in  $X$ , then  $f(p)$  belongs to  $\text{Cl}(f(A))$ .

**Theorem 6.2** Let  $X$  be a metric space and  $Y$  a topological space. Then a function  $f : X \rightarrow Y$  is continuous if and only if for each convergent sequence  $x_n \rightarrow x$ ,  $f(x_n)$  converges to  $f(x)$ .

**Theorem 6.3** Let  $X$  be a compact space and let  $f : X \rightarrow Y$  be a continuous function that is onto. Then  $Y$  is compact.

**Theorem 6.4** Let  $X$  be a separable space and let  $f : X \rightarrow Y$  be a continuous, onto map. Then  $Y$  is separable.

**Theorem 6.5** Let  $A$  and  $B$  be disjoint closed sets in a normal space  $X$ . Then for each dyadic rational  $r$  (that is,  $r$  can be written as a quotient of integers with denominator a power of 2) there exists an open set  $U_r$  such that  $A \subset U_0$ ,  $B \subset (X - U_1)$ , and for  $r < s$ ,  $\text{Cl}(U_r) \subset U_s$ .

**Theorem 6.6** (Urysohn's Lemma) A space  $X$  is normal if and only if for each pair of disjoint closed sets  $A$  and  $B$  in  $X$ , there exists a continuous function  $f : X \rightarrow [0, 1]$  such that  $A \subset f^{-1}(0)$  and  $B \subset f^{-1}(1)$ .

**Theorem 6.7** Let  $X$  be a normal space,  $A$  be a closed subset of  $X$ , and  $f : A \rightarrow [0, 1]$  be a continuous function. Then for any  $r$  in  $(0, 1)$ , there is an open set  $U_r$  in  $X$  such that  $f^{-1}([0, r]) = U_r \cap A$  and  $\overline{U_r} \cap A \subset f^{-1}([0, r])$ .

**Theorem 6.8** (The Tietze Extension Theorem) A space  $X$  is normal if and only if every continuous function  $f$  from a closed set  $A$  in  $X$  into  $[0, 1]$  can be extended to a continuous function  $F : X \rightarrow [0, 1]$ . ( $F$  extends  $f$  means for each point  $x$  in  $A$ ,  $F(x) = f(x)$ .)

**Theorem 6.9** (The Tietze Extension Theorem) A space  $X$  is normal if and only if every continuous function  $f$  from a closed set  $A$  in  $X$  into  $(0, 1)$  can be extended to a continuous function  $F : X \rightarrow (0, 1)$ . ( $\mathbb{R}^1$  could be substituted for  $(0, 1)$  in this theorem.)

**Theorem 6.10** If  $X$  and  $Y$  are metric spaces with metrics  $d_X$  and  $d_Y$  respectively, then a function  $f : X \rightarrow Y$  is continuous if and only if for each point  $x$  in  $X$  and  $\varepsilon > 0$ , there is a  $\delta > 0$  such that for each  $y \in X$  with  $d_X(x, y) < \delta$ , then  $d_Y(f(x), f(y)) < \varepsilon$ .

**Definition 6.2** A function  $f$  from a metric space  $(X, d_X)$  to a metric space  $(Y, d_Y)$  is *uniformly continuous* if and only if for each  $\varepsilon > 0$  there is a  $\delta > 0$  such that for every  $x, y \in X$ , if  $d_X(x, y) < \delta$ , then  $d_Y(f(x), f(y)) < \varepsilon$ .

Give an example of a continuous function from  $\mathbb{R}^1$  to  $\mathbb{R}^1$  which is not uniformly continuous.

**Theorem 6.11** Let  $f : X \rightarrow Y$  be a continuous function from a compact metric space to a metric space  $Y$ . Then  $f$  is uniformly continuous for any choice of metrics for  $X$  and  $Y$ .

**Definition 6.3** A sequence  $\{a_i\}_{i \in \omega}$  in a metric space  $X$  is *Cauchy* if and only if for every  $\varepsilon > 0$ , there exists an  $N$  such that for every  $i, j > N$ ,  $d(a_i, a_j) < \varepsilon$ .

Let  $d_X$  be a metric for a topology on a metric space  $X$ .  $(X, d_X)$  is complete if and only if every Cauchy sequence converges.

**Theorem 6.12** Let  $f_i : (X, d_X) \rightarrow (Y \text{ complete}, d_Y)$  ( $i \in \omega$ ) be a sequence of continuous functions such that for each  $i \in \omega$ , and point  $x$  in  $X$ ,  $d_Y(f_i(x), f_{i+1}(x)) < 1/2^i$ . Then  $\lim_{i \rightarrow \infty} f_i$  exists and is continuous.

**Definition 6.4** A continuous function  $f : X \rightarrow Y$  is *closed* (resp. *open*) if and only if for every closed (resp. open) set  $A$  in  $X$ ,  $f(A)$  is closed (resp. open) in  $Y$ .

**Theorem 6.13** Let  $X$  be compact and  $Y$  Hausdorff. Then any continuous function  $f : X \rightarrow Y$  is closed.

**Definition 6.5** A function  $f : X \rightarrow Y$  is a *homeomorphism* if and only if  $f$  is continuous, 1-1 and onto and  $f^{-1} : Y \rightarrow X$  is also continuous.

**Theorem 6.14** For a continuous function  $f : X \rightarrow Y$ , the following are equivalent:

- a)  $f$  is a homeomorphism.
- b)  $f$  is 1-1, onto and closed.
- c)  $f$  is 1-1, onto and open.

**Definition 6.6** Spaces  $X$  and  $Y$  are *homeomorphic* if and only if there is a homeomorphism  $f : X \rightarrow Y$ .

**Theorem 6.15** For points  $a < b$  in  $\mathbb{R}^1$ , the interval  $(a, b)$  is homeomorphic to  $\mathbb{R}^1$ .

**Theorem 6.16** Suppose  $f : X \rightarrow Y$  is a 1-1 and onto continuous function,  $X$  is compact and  $Y$  is Hausdorff. Then  $f$  is a homeomorphism.

**Theorem 6.17** Let  $f : X \rightarrow Y$  be a function. Suppose  $X = A \cup B$  where  $A$  and  $B$  are closed subsets of  $X$ . If  $f|_A$  is continuous and  $f|_B$  is continuous, then  $f$  is continuous.
